

Roche Diagnostics innovation initiative

Messaging framework & narrative

[Click here to begin →](#)

March 2025

FOR INTERNAL USE ONLY.

Introduction

Why did we develop a Roche Diagnostics Innovation narrative?

You spoke up. We listened.

You asked for a flexible yet unified narrative that tells the story of **why customers can feel confident** in choosing Roche Diagnostics as a partner of choice, based on the dedication of continued innovation over the long-term.

We have a proven track record and product portfolio strategy that demonstrates our commitment to the ongoing optimisation of diagnostics and transformation of healthcare where it makes sense.

This document is intended for internal use and aims to offer guidance on how to tell our innovation story with key laboratory decision makers, highlighting the reasons why partnering with us is advantageous. This document provides the message framework, creative visual guidance and above product/across customer area marketing value proposition, positioning strategy and high level "reasons to believe"

[External-facing innovation presentation](#) (to help set-up product pipeline strategy discussion).

Introduction

The Roche Diagnostics “connective detective” archetype

We are uniquely positioned to be able to build on the existing reputation of trust that already exists for us with customers.

This narrative and all the storytelling tools that support it are built on the archetype of the connective detective—one who seeks answers for the greater good. Our strategic pillars are built on our foundation of cultural beliefs, values and blend of existing messaging pillars.

Starting with “doing now what patients need next”, we also honor the idea of “Innovating diagnostics, transforming healthcare, changing lives”.

And all the way across customer areas, we want to align and support other narrative and customer area messages such as “driving diagnostic certainty for life-saving pathology” (Pathology Lab Customer Area), integration, standardisation, sustainability, advancing science and people, collaboration and partnership .

Introduction

Why do customers care about this narrative?

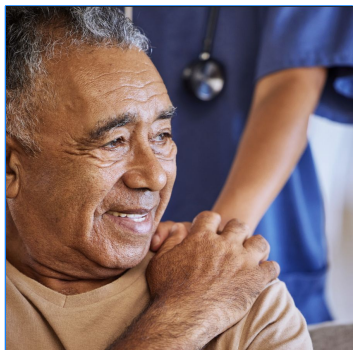

Internal stakeholders confirm our message theme is on target and flexible across many product teams and geographies.

We set out to help customers understand that we are innovative in so many areas, probably ones that are not evident to them, as they only see the very tip of the iceberg when it comes to innovations in diagnostics. Being able to see a fuller picture of our diagnostics offering can support them see that we can be a full-service partner in areas they may not realise in their day-to-day business.

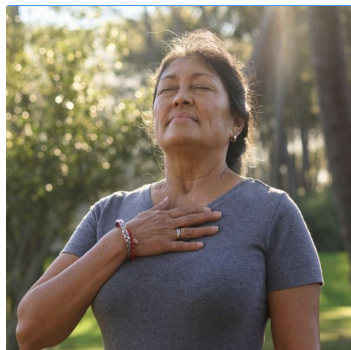

This narrative and all the storytelling tools that support it relate to the archetype of the connective detective—one who seeks answers for the greater good—and three strategic themes: **unified vision**, **undeniable viability** and **inspiring visibility**. We'll delve into each of these pillars throughout this document.

Global product teams and affiliates have the flexibility to expand this library of “big word” ideas and use this creative concept as a bridge to facilitate targeted and focused customer discussions about their own, respective topics.

Positioning, value proposition & vision →

Positioning statement

<i>For</i>	The lab leaders who want to make confident decisions about their lab's future who need a rigorous, insightful partner to help them tackle the world's evolving health challenges
<i>Roche Diagnostics</i>	Gives customers a bedrock foundation for the future based on our broad, proven, interconnected offering
<i>Bringing</i>	Diagnostics from the back office to the forefront so that customers and patients alike can appreciate the role of diagnostics in everyday life
<i>Because</i>	Trust in our diagnostic solutions is of utmost importance and unlike the competition
<i>We are dedicated to</i>	Building our legacy and continuing to delight our customers by solving their problems in ways that may not have been imaginable via: Unified vision: Looking ahead and getting there collaboratively Undeniable viability: Keeping the greater good front and centre as we validate that our solutions work Inspiring visibility: Bringing only the most worthy investigative ideas—which most of us never see—to the forefront as full diagnostic solutions
<i>So that</i>	We seek and find answers for the greater good —so that patients around the world have meaningful equitable access to care for their health

Value proposition

We're empowering wider visibility of diagnostics because of our strong collective vision and commitment to viable outcomes.

We invest more than any of our competitors in the space and it shows in our ability to transform healthcare, whether it's PCR technology-based automation, a new dimension with mass spectrometry, automation, integration and connectedness, a digital or software algorithm breakthrough or the ability to turn biomarker information into medical value.*

Co-creating a vision and following through on it with each other, affiliates, customers and practitioners around the world, we can bring a unified vision to life that meets the needs of the industry as a whole. We're also able to collaborate within Roche, learning from both our Diagnostic and Pharma organizations. Thus, we can benefit from advances we've made in one arena and apply them elsewhere, powering an engine that's built to serve clinicians, practitioners and patients.

Over the last century-plus, we've built a reputation of quality and trust, ensuring innovations exceed customer and patient needs. And those needs are not just technical in nature. We take into account whether our solutions are accessible, reliable and worth it through our commitment to relentless analysis.

When inherent talent meets persistence toward greatness, the result is staggering. It's full of moments of amazement and audible gasps. Especially when we help our customers and their patients shine a light on what's not seen or even felt. We scour the evidence. We put the pieces together. We help solve problems. We have the influence to bring diagnostics from the back office to the forefront of patient outcomes.

Moving customer perception

from
this

to
this

Vision statement

Roche Diagnostics

- **Unified vision:** What we will deliver for the future benefits from the collaborative efforts across an extensive internal and external network of experts, stakeholders and customer partners not only from our Diagnostics division, but also from our Pharma strength.
- **Unmistakable viability:** Our legacy shows that we have the experience and know-how to provide solutions that have the potential to truly transform healthcare across almost all of our key customer areas. When we launch a solution, customers can trust that it is reliable and will stand the test of time.
- **Inspiring visibility:** In order to bring world-class diagnostic solutions to market that customers and patients can rely on and trust, we explore a vast array of technologies, options and ideas. And it's ok that this work is taken for granted, but sometimes what is seen is only the tip of the iceberg in terms of investment for the future.

We believe in **seeking answers for the greater good** so that we can bring diagnostics from the back office to the forefront. We can and will continue bringing game-changing innovations to our customers and, in turn, their patients.

This section outlines our 3 value pillars in turn. When speaking to C-Suite audiences about the overarching Roche Diagnostics Innovation umbrella, a slide for each value pillar should be used to keep the story concise and impactful. These pillars combine to make a powerful proposition to establish Roche as an **experienced and innovative leader** in diagnostics, explain the value that Roche brings as a **partner**. Our solutions impact patient care by aiding clinical decision-making, with the goal to use medical value to help **improve patient outcomes**.

This section provides additional information and some more specific proof points about Roche Diagnostics' portfolio. Explore each portfolio's unique features, benefits and specifications to find the perfect fit for your needs.

This section brings all of the messaging together under a creative concept, featuring guidelines for how to tell the story for specific solutions, as well as a messaging library with headlines and subheadlines for various innovation areas across Roche Diagnostics.

Three value pillars, ladder up to our overarching anchor message

Unified vision

Looking ahead and getting there collaboratively

Undeniable viability

Keeping the greater good front and centre as we ensure our solutions work

Inspiring visibility

Bringing only the most worthy investigative ideas—which most of us never see—to the forefront as full diagnostic solutions

Additional information

Creative

Positioning, value proposition & vision

Message flow

Messaging framework

Messaging framework →

Example message grid

Each message includes a short headline to summarise its content. They can be used within the narrative to provide additional structure or act as the starting point for headlines or subheads in the assets created from this narrative.

The messages are above the product level, setting out an overarching aspiration/vision of the Roche Diagnostics Innovation offering that helps ensure more unified messaging closer to the product level. While the messages may not be customer facing, they should still be well supported wherever possible to ensure that they remain ownable and differentiating.

To bring our key themes to life in a meaningful and compelling way, we have crafted **brief, focused messages to demonstrate how we are helping customers** solve problems and create new opportunities for success. These messages are broad because the way we touch innovation is broad. In the Additional Information section and the Creative Campaign section, there are more specific talking points that lend themselves to more pointed areas of focus.

Looking ahead and getting there collaboratively, with internal expertise and partnerships

Unified vision

Transforming diagnostics, together

Yes, we work together within Roche, but we also collaborate with universities, hospital systems, governments and more to unravel the biggest challenges and challenge the biggest assumptions.

Undeniable viability

Open for business, open for collaboration

Our digital pathology open environment aims to foster collaboration and innovation. We bring together broad, innovative AI-based tools to help clinicians improve and personalise healthcare. We are now integrating more than 20 different AI algorithms from eight new collaborators—and this figure will continue to grow.

Inspiring visibility

Complete care is caring completely

Because Pharma and Diagnostics live under the same roof, our innovations impact patients on an individual level. This allows us to think creatively about their care; hone in on disease areas with the highest burden; collaborate openly and synergise. It allows us to work on solutions that enable clinicians to provide more personalised care for every patient.

Additional information

Prioritising progress

We invest more resources into R&D than any of our competitors across a vast scope and are thus exponentially more capable of driving progress, addressing complex patient-care challenges.*

Creative

Innovation through authenticity

We bring our whole selves to work: our personalities, our perspectives and our diverse backgrounds. Because only then can patients, physicians and researchers collaborate authentically to reveal insights and multiply our impact.

We are passionate about advancing science – no matter where it comes from. We identify the best innovations, whether internal or external, to deliver value. Only by partnering with the brightest minds in science and healthcare, can we serve patients with difficult-to-treat diseases, both now and in future.

Our set-up is designed for innovation. Our autonomous research and development centres and alliances with more than 250 external partners foster a diversity of scientific approaches and agility.

Our global geographical scale and reach enables us to attract talent in the leading global science clusters and to quickly bring our solutions to people who need them

Access: 47% of the global population has little to no access to diagnostics.¹ A partnerships approach is a critical enabler to amplify and accelerate the strengthening of health systems. Working in partnership leverages diverse strengths, capabilities and expertise to reduce and remove barriers for patients to care in a way that no single organisation may be able to achieve on their own.

Other areas of partnership focus include, (but are not limited to):

- Artificial intelligence (AI): <https://www.aiwithroche.com/>
- Workflow automation, data analytics and decision support
- Provider and patient Insights
- Diagnostics solutions
- Biomarkers that address significant unmet medical needs
- Personalised healthcare
- Support services: a holistic approach, including training, consultation and technical assistance, to ensure that our partners can fully leverage our solutions.

13B CHF, ~460 licensing agreements in 2024¹

It can take years to bring a single diagnostic test idea through the process of research & development feasibility, design, clinical validation, manufacturing scale-up, quality control and approval before it becomes commercially available. Not every idea makes it through the rigorous set of steps to prove value. But when they do, the result is a PCR legacy, cutting-edge core lab clinical chemistry and immunochemistry capabilities, digital solution game-changers and next-level product launches. All of which stand to help transform healthcare as we know it today.

Strength and stability

Speed to market is never most important than truly tested, tried and true innovations. We've seen it in the decades-long journey of technologies like PCR and TAGS*, ever-evolving workflow connectivity solutions and navify integration and *Time Magazine's* Best Inventions of the Year: a collaboratively created Alzheimer's antibody and the revolutionary HPV self-test.²

Success through process

We do not prioritise only being first to market because racing to sell undermines patient outcomes. Instead, we meticulously test, retest and test again for solutions patients can trust.

Quality across expertise

Rigorous testing is our maxim. If an idea fails here, then we share it with another cohort there. It's our breadth of disciplines and our extensive clinical trial studies that lead to successful outcomes. It's how we improve the status quo. It's what keeps Roche ahead of care.

Investment in AI-powered diagnostics for the future

To further strengthen our innovation power, we are leveraging state-of-the-art technologies such as artificial intelligence. AI decodes complex biological connections faster, makes diagnostics more precise, facilitates more targeted drug development and much more. Roche has been a pioneer in the use of AI throughout the value chain, setting new benchmarks in healthcare.

Mass spectrometry “super particles”

Mass spectrometry is a technique used to identify and quantify the different molecules in a sample by analysing its physicochemical properties. It is incredibly sensitive and specific and can tell you exactly what's in a substance and how much of each component is present. However, the process was historically cumbersome and manual, requiring highly educated and trained personnel. Automating the testing workflow involved multiple innovations in chemistry, biology, bioinformatics and hardware development, all working in tandem. And it would not be possible without the invention of paramagnetic particles, that have unique magnetic properties and custom binding molecules to allow capture of analytes in bodily fluid with only tiny amounts of a single reagent.*

Breakthrough sequencing capability

Establishing a new category of next-generation sequencing (NGS) through proprietary sequencing by expansion (SBX) technology. SBX chemistry, combined with an innovative sensor module, offers ultra-rapid, high-throughput sequencing that is both flexible and scalable for a broad range of applications. This method involves converting DNA into a longer strand called Xpandomer, which is then read using a nanopore to achieve single-base resolution.**

Multiplexing expansion - within existing technology infrastructure

TAGS – short for temperature-activated generation of signal – is a new polymerase chain reaction (PCR) technique that uses colour, temperature and relatively simple data processing that has the power to triple the number of targets (e.g. viruses) that can be detected in a patient sample with a single diagnostic test, using the standard PCR plate on existing high throughput instruments.***

Digital pathology

Pathologists diagnose cancer by reviewing patient slides at a microscope. With a digital pathology solution there is a high resolution image of the patient slide along with a digital interface allowing pathologists to diagnose a case from anywhere, at any time. Telepathology and remote diagnosis have the potential to expand patient access to those living in more rural and remote communities who may have historically faced challenges to get diagnosed. When paired with the power of immunohistochemistry multiplexing, even more gains can be made to develop and share clinical insights while still preserving precious, limited tissue sample. This may also minimise the need for an unnecessary patient visit for repeat, invasive biopsy procedures. Currently researchers are working on these digital pathology solutions as an opportunity for the future*

Near patient care - expanding access through more decentralizing testing

Continuous glucose monitoring (CGM) solutions are increasingly pivotal in diabetes management, as CGM becomes the standard for glucose monitoring among individuals with diabetes. Roche reached a significant milestone with the CE marking of the Accu-Chek® SmartGuide, our first CGM solution that includes AI-powered predictive algorithms.

With the acquisition of LumiraDx's point-of-care technology, we have a user-friendly, portable platform that consolidates a range of immunoassays and clinical chemistry tests onto a single device. This platform extends the diagnostic offering in decentralised settings, such as primary care and pharmacies, as well as in low- and middle-income countries, helping drive global access to timely, actionable diagnostic results.

navify® digital solutions portfolio

Tackling digital infrastructure and operational challenges across labs & point of care settings by securely connecting data, simplifying workflows and monitoring processes and community networks. Digital solutions with medically certified algorithms help aid in early detection across different disease spectrums. Clinical workflow, displaying & aggregating patient data supports multidisciplinary team decisions at each stage of the patient journey. Digital solutions can also provide continuous monitoring of patients, enhancing patient engagement and enabling early detection, preventive measures and chronic disease care.

Multiplexing - expanding technology capabilities

The cobas® eplex system tests for infectious diseases, specifically with test panels for respiratory infections and also bloodstream infections, which can lead to sepsis, along with panels in development for gastrointestinal infections, meningitis and encephalitis. Using multiplex testing not only helps solve the diagnosis and management for each affected patient, it also contributes to reduce antibiotic resistance and promote antimicrobial stewardship efforts to help address the growing problem of antibiotic resistance.

*Currently in development; not all products are commercially available in all countries.

Reasons to believe examples - medical value through innovation; expanding claims for existing assays

Elecsys® Anti-Müllerian Hormone (AMH) Plus immunoassay

Expanded indication allows the AMH test to be used as a diagnostic tool to identify polycystic ovarian morphology (PCOM) in women with suspected PCOS. PCOM is one of the three diagnostic criteria of PCOS and this update means that the AMH biomarker can now be used as a replacement for transvaginal ultrasound to determine PCOM in adult women.

cobas® HPV test to enable clinician-guided, patient self-collection of the sample

Leads to more effective and sustainable access to cervical screening services enabling detection of pre-cancer and prevent progression to cervical cancer

HER2 low and ultra-low breast cancer companion diagnostics

New indications for the PATHWAY anti-HER2/neu (4B5) Rabbit Monoclonal Primary Antibody*, the first companion diagnostic to identify patients with HER2 low metastatic breast cancer eligible for ENHERTU® now also includes identification of patients with *HER2-ultralow* metastatic breast cancer. The expansion of the intended use to include HER2-ultralow now further extends potential patient eligibility for ENHERTU by an additional 20-25%.

This test is also the first and only FDA-approved companion diagnostic to aid in the assessment of HER2-positive status to identify patients who are eligible for treatment with ZIHERA® (zanidatamab-hrii). Already indicated as an aid to identify breast cancer patients eligible for HER2-targeted treatment with Herceptin®, KADCYLA® or ENHERTU®, the introduction of the new indication for BTC represents a significant expansion of the test's clinical utility to address unmet medical need.

New dual claim for blood screening and diagnostics

The World Health Organization (WHO) estimates that DENV is endemic in more than 100 countries, with >2.5 billion people at risk in certain regions of the world.¹ Direct detection of chikungunya virus (CHIKV) RNA and dengue virus (DENV) serotypes 1-4 RNA in human plasma is possible using the **cobas®** CHIKV/ DENV test in markets that accept the CE mark. Intended for use to screen donor samples for CHIKV RNA or DENV RNA alone or to simultaneously screen for both CHIKV and DENV RNA in plasma from individual human donors, with this claim extension, the test may now also be used as an aid in diagnosis for CHIKV or DENV in samples collected from individuals suspected of infection with chikungunya or dengue viruses by their healthcare provider.

Reasons to believe examples - medical value through innovation; achieving more personalised healthcare for individuals

Driving diagnostic certainty for life-changing decisions in oncology.

Our focus is on doing what we can to help pathologists and clinicians with clinically relevant information that can change the course of a patient life, when faced with a cancer diagnosis. We have 14 FDA-approved companion diagnostics tests for more than 80 indications: FDA List of Cleared or Approved Companion Diagnostic Devices (In Vitro and Imaging Tools).¹ And of the projected 15 best cancer drugs for 2022, Roche is the provider or co-provider of seven of them.²

- **Advancing Science** - count on Roche to continuously improve oncology diagnostics through innovations of the highest quality, guided by the top minds in medical science. We relentlessly push to higher standards of excellence and combined expertise across translational research, diagnostics, digital insights and pharmaceuticals to solve our customers' challenges. As an example, in 2024 we were first to launch a Kappa Lambda Dual ISH mRNA assay as an ultrasensitive option to aid in the diagnosis of B-cell lymphomas.³
- **Accelerating Answers** - Our comprehensive portfolio aims to simplify and optimise clinical decisions, to enable healthcare professionals to quickly deliver the answers patients need, for monitoring and managing of treatment.
 - As a leader in digital pathology, we offer 7 Roche-developed image analysis algorithms and partner with 3rd party algorithm developers help pathologists objectively assess whole tissue slide images for clinical or research utility⁴
 - Our solutions are in line with clinical guidelines, to help ensure sample is used in the most impactful way and provides diagnostic options for different patient needs: sample type, cost vs TAT, or less invasive options.⁵
 - We help generate insights with clinical decision support (e.g. navify® OncoHub) to create and connect results and stakeholders. We also help connect the MDT with solutions to facilitate stakeholder collaboration and coordination along the pathway⁶ as well as through navify® Tumor Board and navify® Mutation Profiler digital solutions.
- **Amplifying Impact** - Be confident in our commitment to helping you improve labs and lives through flexible, sustainable solutions and close collaboration with the global oncology community. We actively support partnerships through a network of experts in sub-specialty training, clinical study investment, healthcare consulting and expanding access.

Uncovering the iceberg

Behind the scenes R&D, global operations, leadership, people and culture; plus our ever-evolving sustainability, diversity and AI ambitions – there's more to Roche than what you see. Our goal? To bring greater visibility and accessibility to our myriad innovations, internal and external. R&D innovation story found here: <https://www.roche.com/innovation/structure/diascience>

Diagnostics, illuminated

Our collaborative approach allows us to tailor solutions and forge healthier futures for patients through personalised care, bringing diagnostics out of obscurity and into the zeitgeist.

Where we've been, where we're going

We pioneered PCR testing and brought it from the back office to the front lines, along with more automation, efficiency and simplification. And we'll continue to shine a light on newer innovations (like Mass Spectrometry* and TAGS* multiplexing examples) to ensure patients, practitioners and researchers have access to our most powerful solutions.

Inventing sequencing by expansion: a DNA sequencing breakthrough*

After countless experiments and nearly 10 years of work, Roche unveils its new “SBX” (sequencing by expansion) technology that has the potential to revolutionise the way DNA is sequenced.

See the unseen

Some of our most powerful innovations—from AI to machine learning to interconnected digital systems, some within Roche and some as collaborations with partners—don't get a lot of time in the spotlight, but they have the power to truly improve patient outcomes.

Addressing unmet patient needs in burdensome diseases

In 2024, Roche was granted FDA Breakthrough Device Designations for two blood-based tests that represent significant advancements in disease areas with growing societal burden. One test is the Tina-quant Lp(a) assay, which measures a critical marker for people at risk of cardiovascular disease who could benefit from targeted therapy. The other test is the Elecsys pTau217 plasma assay, which identifies the presence or absence of amyloid pathology, a pathological feature of Alzheimer's disease.

*Mass Spectrometry and SBX are in development and not commercially available.

Campaign story

We are innovators. Evidence-based detectives. And unrelenting truth-seekers.

Roche Diagnostics has been at the forefront of scientific breakthroughs for the past century, quietly pushing healthcare forward and improving processes for scientists, practitioners and patients alike.

Our collaborative digital ecosystem allows us to connect different areas of expertise throughout Roche to leverage diagnostic data and discover hidden answers to healthcare's biggest questions.

From mass spectrometry innovation to the continued evolution of legacy PCR testing to collaborative research across all areas of clinical chemistry, immunochemistry, pathology lab developments, digital health solutions, next generation systems and more, Roche Diagnostics is, and always will be, ahead of care.

INSTRUCTIONS: Use these headlines and optional subheadlines to illustrate how different areas of innovation fit into the Ahead of care concept. Get accompanying images here.

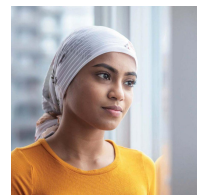

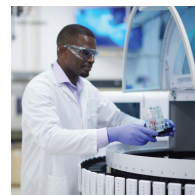

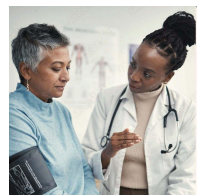

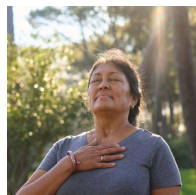

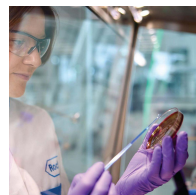

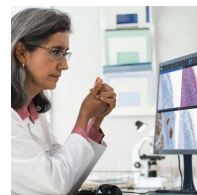

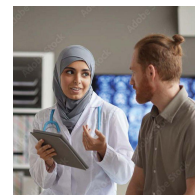

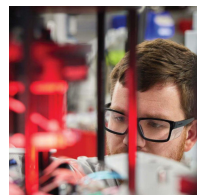

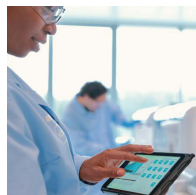

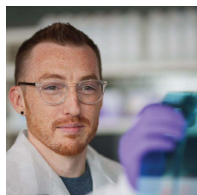

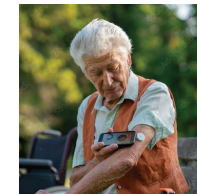

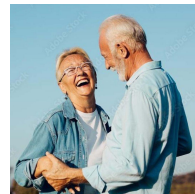

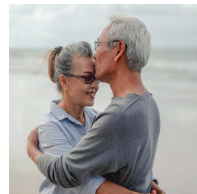

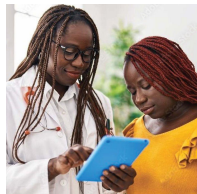

Ahead of care (hero)	Understanding that a patient's diagnosis is the first step necessary before a disease can be stopped, cured or prevented
next generation technologies	Getting to precision with more speed and less hands-on time via molecular and sequencing automation
collaboration	Transforming powerful ideas, into research and action, together
neurological disorders	Paving the way for early disease treatment and efficient monitoring to preserve what makes people who they are
proven hypothesis	Generating and leveraging the data necessary to prove medical value and bring insights to patient care decisions
PCR testing	Establishing a transformative legacy and enduring foundation for the future
multiplexing	Using novel scientific advancements to maximise insights from a single sample
connectivity	Simplifying lab operations and integrating systems through hands-free workflow and data linkages
integration	Simplifying workflows through system connectivity and smart diagnostic algorithms to create a paperless, hands-free future
new dimensions	Using expertise in automation and science to revolutionise mass spectrometry technology
scientific boundaries	Using expertise in systems and science to revolutionise reading the DNA code in next generation sequencing
AI-powered diagnostics	Enabling improving precision and faster progress towards data driven decision-making
digital health	Harnessing diagnostic data to better utilise insights for more informed patient care

Example creative | Headline + subhead library (continued)

Ahead of...	
cardiac conditions	Staying steps in front of devastating heart-related events
excellence	Raising the bar for fast, reliable, accurate, sensitive and specific results for more personalised care
near patient care	Delivering quick diagnostic answers straight to the clinician and patient, when and where they need it
expectant parents	Helping safeguard pregnancy journeys from the start with fertility, non-invasive prenatal testing and preeclampsia monitoring
cervical cancer	Helping ensure no woman dies from a preventable disease and encouraging use of all the tools possible to do so
ALT 1: public health emergencies Other big word options: pandemic readiness, epidemics, rapid response, infectious disease	Outsmarting outbreaks and stopping the spread of disease by harnessing the power of diagnostic information
highs & lows	Helping move diabetes patients' glucose levels into safe range with personalised results and precision
end-to-end pathology	Accelerating tissue diagnostic capabilities with novel, multiplexing solutions based on 40 years of VENTANA® experience
diagnosis	Alt 1: Promoting lifelong health by screening to identify risk for disease and help prevent its development or progression Alt 2: Promoting lifelong health with early detection and monitoring of disease with the goal of more immediate action to help cure or stop progression
sepsis	Addressing the diagnosis and management for each affected patient while supporting appropriate use of antibiotics to protect the future
staff shortages	We free people from unnecessary work to create time for the essentials
oncology diagnostics	Investing in innovation across the patient journey, from screening to diagnosis to defining treatment options and disease monitoring

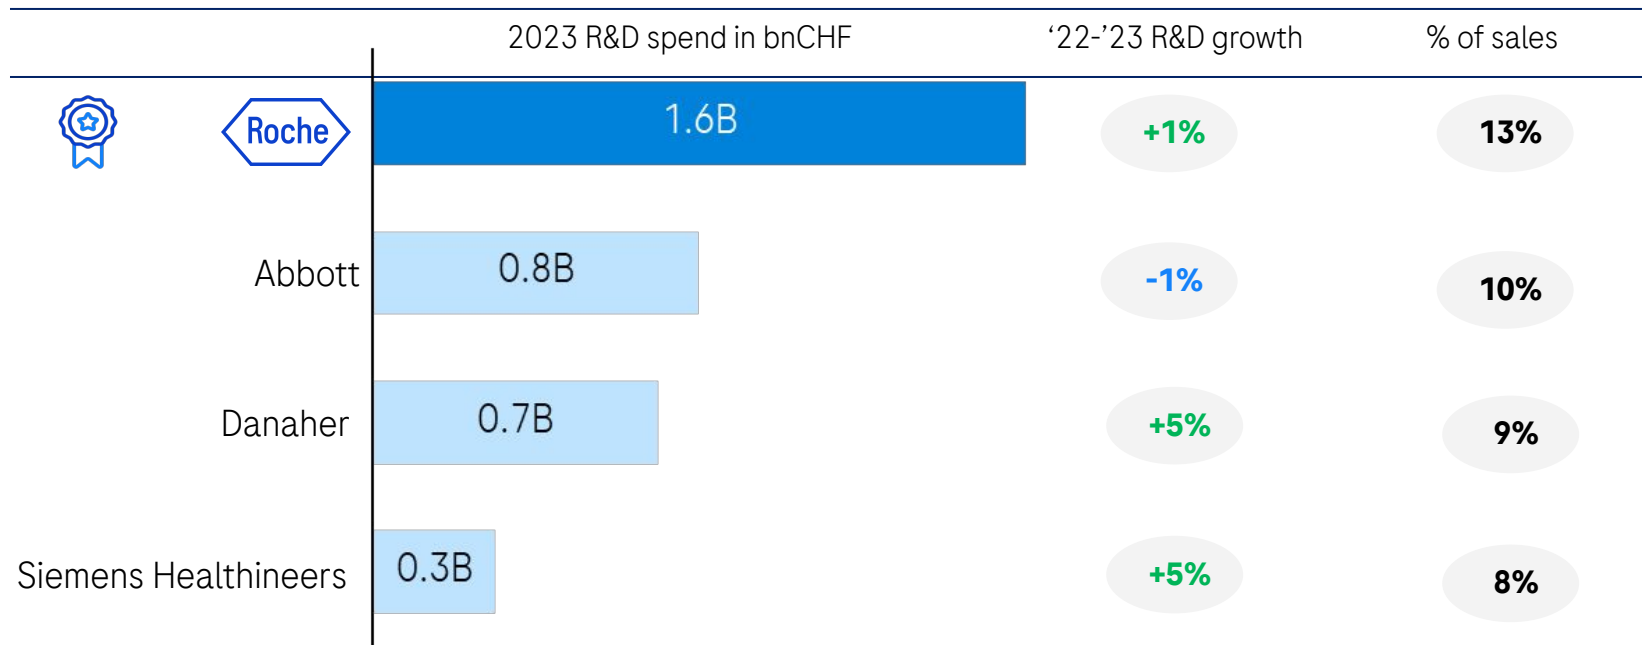

Example imagery

The imagery in this campaign should focus on patient care and how the innovations are a huge step toward better patient outcomes. Even in cases where we want to illustrate the innovation itself, we should be sure to show humanity – lab workers, providers or patients.

Ahead of

care

Understanding that a patient's diagnosis is the first step necessary before a disease can be stopped, cured or prevented
